

Power BI Sales Analytics Dashboard Report

Retail Sales Data Analysis Using Microsoft Power BI

Project Report

Sample Superstore Dataset

Prepared by: Sumit Kumar

June 21, 2026

Acknowledgement

I would like to express my gratitude to Microsoft Learn, the Power BI Community, and various educational resources that supported the successful completion of this project.

Special thanks to the creators of the Sample Superstore dataset, which provided an excellent platform for developing practical Business Intelligence and Data Analytics skills.

This project helped strengthen my understanding of Power Query, Data Modeling, DAX, Dashboard Design, Data Visualization, and Business Analytics while applying industry-standard reporting practices.

Executive Summary

This report presents the development of a Sales Analytics Dashboard using Microsoft Power BI and the Sample Superstore dataset. The objective of the project was to transform raw retail transaction data into meaningful business insights through data cleaning, modeling, visualization, and interactive reporting.

The analysis revealed total sales of approximately 2.30*Million*, *total profit of approximately 286* Thousand, and more than 5,000 customer orders. Regional analysis identified the West Region as the highest-performing region in terms of both sales and profitability. Product analysis highlighted the Canon imageCLASS 2200 Advanced Copier as one of the top-performing products, while customer analysis identified Sean Miller and Tamara Chand as key contributors to sales and profit performance.

The project followed an end-to-end Business Intelligence workflow including data preparation using Power Query, data modeling with a Star Schema, DAX measure development, dashboard creation, business insight generation, and GitHub publication.

The final solution consists of four dashboard pages:

- Executive Overview
- Product Performance Analysis
- Customer Analysis
- Regional Performance Analysis

The dashboard provides decision-makers with an interactive platform for monitoring business performance, identifying opportunities, and supporting data-driven decision-making.

Section 1: Project Overview

This project focuses on analyzing retail sales data using Microsoft Power BI and transforming raw transactional data into meaningful business insights. The project follows a complete Business Intelligence workflow, including data cleaning, data modeling, DAX measure development, dashboard design, and business insight generation.

The dashboard was developed using the Sample Superstore dataset and provides decision-makers with an interactive view of sales performance, product performance, customer behavior, and regional trends.

The final solution consists of four dashboard pages:

- Executive Overview
- Product Performance Analysis
- Customer Analysis
- Regional Performance Analysis

The project demonstrates practical skills in Power BI, Power Query, DAX, data modeling, dashboard development, documentation, and GitHub project management. It is designed as a portfolio-quality business intelligence project suitable for showcasing analytical, technical, and reporting capabilities.

Section 2: Business Objectives

The primary objective of this project is to analyze retail sales data and generate actionable business insights through interactive dashboards.

The project aims to answer the following business questions:

- What is the overall sales performance of the company?
- Which regions contribute the highest sales and profit?
- Which product categories and products generate the highest revenue?
- Who are the most valuable customers?
- How do customer segments contribute to business performance?
- Which states generate the highest sales and profit?
- How has sales performance changed over time?
- What opportunities exist to improve profitability and business growth?

The project was designed to support data-driven decision-making through visual analytics, interactive reporting, and clear business interpretation.

Section 3: Project Workflow

The project followed a structured Business Intelligence workflow to ensure data quality, analytical accuracy, and effective reporting.

Project Workflow

1. Business Understanding
2. Data Collection
3. Data Cleaning and Validation
4. Data Modeling
5. DAX Measure Development
6. Dashboard Design
7. Business Insight Generation
8. Documentation and Reporting
9. GitHub Publication

This workflow follows industry-standard data analytics practices and helps transform raw data into actionable business insights.

Project Architecture

The overall project architecture followed a structured Business Intelligence workflow from data acquisition to business insight generation.

Sample Superstore Dataset ↓ Power Query Data Cleaning ↓ Data Modeling (Star Schema) ↓ DAX M

The architecture ensured data quality, analytical accuracy, dashboard performance, and effective business reporting.

Section 4: Dataset Information

The dataset used in this project is the Sample Superstore Dataset, a widely used retail dataset for business intelligence and data analytics projects. The dataset contains transactional sales records and provides information related to customers, products, orders, sales, profit, quantity, and geographical locations.

The dataset enables comprehensive analysis of sales performance, product performance, customer behavior, and regional profitability.

Dataset Summary

Table 4.1: Dataset Summary

Attribute	Details
Dataset Name	Sample Superstore Dataset
Number of Rows	9,994
Number of Columns	21
Data Type	Retail Transactional Data

Key Fields

The following fields were used throughout the analysis:

- Order ID
- Order Date
- Ship Date
- Customer ID
- Customer Name
- Segment
- Product ID

- Product Name
- Category
- Sub-Category
- Region
- State
- City
- Sales
- Profit
- Quantity

These fields provided the foundation for creating business metrics, visualizations, and analytical insights.

Data Dictionary

A data dictionary was prepared to define the key fields used in the dashboard and explain their business meaning. This helps improve documentation quality and makes the report easier to understand for both technical and non-technical readers.

Table 4.2: Data Dictionary

Column Name	Business Description
Order ID	Unique identifier assigned to each customer order. It was used to calculate total orders and analyze transaction-level activity.
Order Date	Date on which the order was placed. It was used for time-based analysis and sales trend reporting.
Ship Date	Date on which the order was shipped to the customer. It supports delivery and fulfillment analysis.
Customer ID	Unique identifier assigned to each customer. It was used to count customers and analyze customer-level performance.

Customer Name	Name of the customer who placed the order. It was used in customer ranking and profitability analysis.
Segment	Customer segment such as Consumer, Corporate, or Home Office. It was used to compare business performance across customer groups.
Product ID	Unique identifier assigned to each product. It supports product-level analysis and product tracking.
Product Name	Name of the product sold. It was used to identify top-performing and low-performing products.
Category	Main product category, such as Furniture, Office Supplies, or Technology. It was used to analyze category-level sales contribution.
Sub-Category	Detailed product classification under each category. It was used for deeper product performance analysis.
Region	Geographic region where the sale occurred. It was used to compare regional sales and profitability.
State	State where the customer or order was located. It supported geographic and state-level performance analysis.
City	City associated with the order. It provided additional geographic detail for regional analysis.
Sales	Revenue generated from each transaction. It was the primary measure for sales performance analysis.
Profit	Profit earned from each transaction. It was used to measure profitability across products, customers, and regions.
Quantity	Number of units sold in each transaction. It was used to analyze product demand and sales volume.

Section 5: Data Cleaning and Validation

Before performing any analysis, the dataset was cleaned and validated using Power Query to ensure data quality, consistency, and reporting accuracy.

The following data preparation steps were performed:

1. Imported the dataset into Power BI Desktop.
2. Verified all column data types.
3. Converted Order Date and Ship Date fields into proper Date format.
4. Performed data profiling using:
 - Column Quality
 - Column Distribution
 - Column Profile
5. Checked for missing values.
6. Checked for data inconsistencies and errors.
7. Verified duplicate records.
8. Validated categorical fields.
9. Confirmed dataset readiness before modeling.

Power Query Data Preparation Screenshot

Power Query was used as the main data preparation tool for importing, profiling, validating, and transforming the dataset before dashboard development. As shown in [Figure 5.1](#), the data was reviewed using Power Query features such as column quality, column distribution, and column profile. These checks helped confirm that the dataset was clean, properly structured, and suitable for analysis.

Figure 5.1: Power Query Data Cleaning and Validation View

Data Cleaning Results

The analysis confirmed that:

- No missing values were detected.
- No duplicate records were identified.
- No major data quality issues were found.
- Date fields were successfully standardized.
- Dataset was suitable for analytical reporting and dashboard development.

The cleaned dataset served as the foundation for all subsequent analysis and dashboard creation.

Section 6: Data Modeling

A robust data model was developed to support efficient reporting, DAX calculations, and time-based analysis.

Date Table Creation

A dedicated Date Table was created to support time intelligence calculations and improve model performance.

The Date Table was linked to the Orders table using the Order Date field.

Relationship Created

$$DateTable[Date] \rightarrow Orders[OrderDate]$$

The final data model is shown in Figure [6.1](#). The model was structured to support clean relationships, reliable filtering, and accurate DAX-based calculations.

Figure 6.1: Power BI Data Model

Model Design

The data model follows a Star Schema design.

Benefits of the Star Schema include:

- Improved query performance
- Simplified relationships
- Better scalability
- Easier maintenance
- Support for advanced DAX calculations

Date Attributes Created

The following date attributes were generated:

- Year
- Quarter
- Month Number
- Month Name
- Year Month

Model Validation

After creating the relationships and Date Table, the model was validated to ensure:

- Correct filter propagation
- Accurate measure calculations
- Consistent dashboard performance

The final model provided a scalable structure for dashboard development and business analysis.

6.1 Dashboard Performance Optimization

Several optimization techniques were applied to improve dashboard performance and maintain efficient report execution.

- Unnecessary columns were excluded from analysis.
- Data types were validated and optimized in Power Query.
- A Star Schema model was implemented to reduce complexity.
- Reusable DAX measures were developed to minimize redundancy.
- Relationships were designed to ensure efficient filter propagation.
- A dedicated Date Table was created for time intelligence calculations.

These optimizations improved dashboard responsiveness, scalability, and maintainability.

Section 7: DAX Measures

Several DAX measures were created to calculate key business metrics and support dashboard visualizations.

Core Measures

Total Sales

Calculates the total sales revenue generated.

```
Total Sales =  
SUM(Orders[Sales])
```

Total Profit

Calculates the total profit earned.

```
Total Profit =  
SUM(Orders[Profit])
```

Total Orders

Counts the total number of unique orders.

```
Total Orders =  
DISTINCTCOUNT(Orders[Order ID])
```

Total Quantity

Calculates the total quantity sold.

```
Total Quantity =  
SUM(Orders[Quantity])
```

Profit Margin %

Measures profitability as a percentage of sales.

```
Profit Margin % =  
DIVIDE([Total Profit],[Total Sales])
```

Average Order Value

Calculates average revenue generated per order.

```
Average Order Value =  
DIVIDE([Total Sales],[Total Orders])
```

Additional Dashboard Measures

The following measures were developed for Product, Customer, and Regional Analysis pages:

- Total Products
- Total Categories
- Total Sub-Categories
- Average Product Profit
- Highest Product Sales
- Total Customers
- Total Segments
- Average Customer Sales
- Average Customer Profit
- Highest Customer Sales
- Total Regions
- Total States
- Highest Region Sales
- Highest Region Profit

- Average State Sales

These measures enabled KPI cards, trend analysis, ranking analysis, and interactive dashboard reporting.

Section 8: KPI Results

The dashboard generated the following key performance indicators from the Sample Superstore dataset.

Table 8.1: Dashboard KPI Results

KPI	Value
Total Sales	\$2.30 Million
Total Profit	\$286 Thousand
Total Orders	5,009
Profit Margin	12.47%
Average Order Value	\$458.61
Total Products	1,849+
Total Categories	3
Total Sub-Categories	17
Total Customers	793
Total Segments	3
Total Regions	4
Total States	49

These KPIs provide a high-level summary of business performance and serve as the foundation for detailed analysis throughout the dashboard.

Section 9: Dashboard Navigation

The dashboard was organized into four pages to provide a clear and logical analytical flow. Each page focuses on a specific business area and allows users to move from a high-level summary to more detailed analysis.

Executive Overview

The Executive Overview page provides a summary of overall sales, profit, orders, profit margin, and average order value. It is designed for quick performance monitoring and executive-level decision-making.

Product Performance Analysis

The Product Performance Analysis page focuses on product categories, sub-categories, and individual products. It helps identify high-revenue products, profitable products, and product groups that may require business attention.

Customer Analysis

The Customer Analysis page evaluates customer contribution, customer profitability, and segment-level performance. It supports the identification of high-value customers and important customer groups.

Regional Performance Analysis

The Regional Performance Analysis page provides geographic insights by region and state. It helps compare sales and profit across locations and supports regional strategy planning.

Section 10: Dashboard Development

The dashboard was developed using Microsoft Power BI Desktop and designed to provide users with an interactive analytical experience.

The final solution consists of four dashboard pages, each focusing on a different business area.

1. Executive Overview Dashboard

The Executive Overview page provides a high-level summary of business performance. Figure 10.1 presents the main dashboard page used to monitor sales trends, regional performance, and category-level sales distribution.

Key KPIs

- Total Sales
- Total Profit
- Total Orders
- Profit Margin %
- Average Order Value

Visualizations

- Sales Trend from 2014 to 2017
- Sales by Region
- Sales Distribution by Category
- Year Filter
- Region Filter

Dashboard Screenshot

Figure 10.1: Executive Overview Dashboard

2. Product Performance Analysis Dashboard

This page focuses on product-level sales and profitability analysis. Figure 10.2 shows the dashboard view used to compare products, categories, and sub-categories based on revenue and profit contribution.

Key KPIs

- Total Products
- Total Categories
- Total Sub-Categories
- Average Product Profit
- Highest Product Sales

Visualizations

- Top 10 Products by Sales

- Top 10 Products by Profit
- Sales by Sub-Category
- Profit by Sub-Category
- Product Performance Table
- Category Filter
- Sub-Category Filter
- Product Search Filter

Dashboard Screenshot

Figure 10.2: Product Performance Analysis Dashboard

3. Customer Analysis Dashboard

This page analyzes customer purchasing behavior and customer profitability. Figure 10.3 displays the customer analysis dashboard, which highlights top customers, customer segments, and customer-level performance.

Key KPIs

- Total Customers
- Total Segments
- Average Customer Sales
- Average Customer Profit
- Highest Customer Sales

Visualizations

- Top 10 Customers by Sales
- Top 10 Customers by Profit
- Sales by Segment
- Profit by Segment
- Customer Performance Table
- Segment Filter
- Customer Search Filter

Dashboard Screenshot

Figure 10.3: Customer Analysis Dashboard

4. Regional Performance Analysis Dashboard

This page provides geographic analysis of sales and profitability. Figure 10.4 presents regional and state-level performance insights that support location-based business decisions.

Key KPIs

- Total Regions
- Total States
- Highest Region Sales

- Highest Region Profit
- Average State Sales

Visualizations

- Sales by Region
- Profit by Region
- Top 10 States by Sales
- Top 10 States by Profit
- Regional Performance Table
- Region Filter
- State Filter

Dashboard Screenshot

Figure 10.4: Regional Performance Analysis Dashboard

The dashboard was designed using a consistent layout, interactive slicers, KPI cards, and visual analytics principles to improve usability and business understanding.

Section 11: Interactive Features

The dashboard includes several interactive features to improve usability, exploration, and business analysis.

Slicers

Slicers were added to allow users to filter the dashboard by key business dimensions such as year, region, category, sub-category, segment, customer, and state. These slicers help users focus on specific areas of interest without changing the underlying report structure.

Search-Enabled Filters

Search-enabled filters were used for fields with many values, such as customer names and product names. This improves navigation and allows users to quickly locate a specific customer or product.

Cross-Filtering

Power BI cross-filtering was used to connect visuals across each dashboard page. When users select a region, category, customer segment, or product, related charts and KPI cards update automatically to reflect the selected context.

Dynamic KPI Updates

The KPI cards were designed to update dynamically based on user selections. This allows users to compare performance across different regions, products, customers, and time periods.

Interactive Dashboard Navigation

The dashboard structure supports interactive navigation across the four analysis pages. Users can move from the Executive Overview to detailed product, customer, and regional analysis pages to investigate business performance at multiple levels.

11.1 Dashboard Design Principles

Several dashboard design principles were followed to ensure usability, readability, and effective communication of business insights.

KPI-First Design

Key performance indicators were placed at the top of each dashboard page to provide immediate visibility of business performance.

Consistent Layout

All dashboard pages follow a consistent layout structure to improve user navigation and reduce cognitive load.

Interactive Analysis

Slicers and search-enabled filters allow users to explore data dynamically without modifying the report structure.

Business-Focused Visualizations

Charts and tables were selected based on their ability to answer specific business questions and support decision-making.

Visual Consistency

A consistent color palette, typography style, and dashboard structure were maintained throughout the project.

Data Storytelling

Visualizations were arranged to guide users from summary-level KPIs to detailed business insights.

Section 12: Key Insights

The analysis of the Sample Superstore dataset revealed several important business insights.

1. The company generated total sales of approximately \$2.30 Million and total profit of approximately \$286 Thousand.
2. The overall profit margin was approximately 12.47%, indicating healthy profitability.
3. The West Region emerged as the highest-performing region, generating approximately \$725K in sales and more than \$108K in profit.
4. California was identified as the top-performing state in both sales and profitability.
5. The Technology category contributed the highest share of total sales among all product categories.
6. Consumer Segment generated the highest sales and profit among all customer segments.
7. Sean Miller was identified as the highest-sales customer.
8. Tamara Chand generated the highest customer profit.
9. Canon imageCLASS 2200 Advanced Copier was one of the highest-performing products in both sales and profitability.
10. Sales demonstrated a generally increasing trend between 2014 and 2017, indicating business growth over time.
11. Regional, customer, and product-level analysis revealed multiple opportunities for business expansion and profitability improvement.
12. Interactive dashboard filters enabled detailed exploration of sales, products, customers, and regional performance.

12.1 Business Impact

The dashboard provides significant value for business users and decision-makers by enabling faster access to performance insights and supporting data-driven decision-making.

The key business benefits include:

- Improved visibility into sales and profitability performance.
- Identification of high-performing products and customer segments.
- Better understanding of regional business performance.
- Enhanced monitoring of business KPIs.
- Support for strategic planning and resource allocation.
- Faster identification of growth opportunities and risk areas.
- Improved reporting efficiency through dashboard automation.

The solution demonstrates how Business Intelligence tools can transform raw transactional data into actionable business knowledge.

Section 13: Business Recommendations

Based on the findings from the analysis, the following recommendations are proposed:

- Focus expansion efforts in high-performing regions such as the West Region.
- Increase investment in Technology products due to strong revenue contribution.
- Develop customer retention strategies for high-value customers.
- Improve performance in lower-profit states through targeted sales initiatives.
- Expand marketing efforts for high-performing customer segments.
- Continuously monitor product profitability to improve inventory planning.
- Use dashboard insights to support data-driven decision-making.
- Regularly track sales and profitability trends to identify future growth opportunities.
- Utilize customer segmentation to improve targeted marketing campaigns.
- Implement advanced forecasting techniques to support strategic planning.

Section 14: Tools Used

The following tools and technologies were used throughout the project:

- Microsoft Power BI Desktop
- Power Query
- DAX Data Analysis Expressions
- Data Modeling
- Microsoft Excel
- GitHub
- LaTeX Overleaf

Section 15: Skills Demonstrated

This project demonstrates practical data analytics and business intelligence skills.

Data Preparation

- Data Cleaning
- Data Validation
- Data Profiling
- Power Query

Data Modeling

- Star Schema Design
- Relationship Management
- Data Table Creation
- Time Intelligence Support

DAX Development

- KPI Development
- Aggregation Measures
- Business Calculations
- Analytical Measures

Dashboard Design

- Data Visualization
- Interactive Filtering
- KPI Cards
- Dashboard Navigation
- Conditional Formatting
- User Experience Design

Business Analytics

- Sales Analysis
- Product Performance Analysis
- Customer Analysis
- Regional Performance Analysis
- Business Insight Generation
- Data Storytelling

Professional Skills

- Documentation
- Report Writing
- GitHub Project Management
- Analytical Thinking
- Problem Solving

Section 16: Challenges Faced and Solutions

Throughout the project, several technical and analytical challenges were encountered.

Date Conversion Issues

Challenge

Date fields required validation and formatting before analysis.

Solution

Data types were verified and corrected in Power Query to ensure accurate date-based reporting.

Data Modeling Challenges

Challenge

Building an efficient model for time-based analysis required proper relationship management.

Solution

A dedicated Date Table was created and connected to the Orders table using a one-to-many relationship.

Dashboard Design Challenges

Challenge

Maintaining consistency across multiple dashboard pages while ensuring readability.

Solution

A standardized dashboard layout, color scheme, KPI structure, and visual design approach were implemented.

DAX Development Challenges

Challenge

Developing reusable business measures for multiple dashboard pages.

Solution

Measures were created using DAX and reused throughout the dashboard to ensure consistency and maintainability.

Key Learnings

- Importance of data quality before analysis.
- Practical implementation of Star Schema modeling.
- DAX measure development.
- Interactive dashboard design.
- Business insight generation.
- GitHub project documentation.
- Professional reporting using LaTeX.

Section 17: Project Outcomes

The project successfully achieved the following outcomes:

- Developed a professional multi-page Power BI dashboard.
- Implemented a scalable Star Schema data model.
- Created reusable DAX measures and KPIs.
- Generated actionable business insights.
- Identified high-performing products, customers, regions, and states.
- Improved analytical reporting capabilities.
- Strengthened practical Power BI and Business Intelligence skills.
- Published the project on GitHub for portfolio visibility.
- Created comprehensive project documentation and reporting.

The project demonstrates end-to-end Business Intelligence development using Power BI.

17.1 Project Limitations

Although the dashboard provides valuable business insights, several limitations should be acknowledged.

- The analysis is based on a sample dataset rather than real-world enterprise data.
- The dashboard does not currently support real-time data refresh.
- Forecasting and predictive analytics were not implemented.
- Row-Level Security (RLS) was not configured.
- Geographic map visualizations were not included.

- Customer lifetime value and advanced segmentation techniques were outside the project scope.

These limitations provide opportunities for future enhancement and further development of the solution.

Section 18: Future Enhancements

The project can be further enhanced through the following improvements:

- Power BI Service Deployment
- Drill-through Reports
- Row-Level Security RLS
- Forecasting and Trend Analysis
- Advanced DAX Optimization
- Mobile Dashboard Layout
- Real-Time Data Integration
- Advanced Customer Segmentation
- Geographic Mapping Visualizations
- Automated Data Refresh Pipelines

These enhancements would improve scalability, accessibility, and analytical depth.

Section 19: References

- [Power BI Community Documentation](#)
- [DAX Documentation](#)
- [Microsoft Power Query Documentation](#)

Section 20: Project Repository

The complete project, including Power BI dashboard files, dataset, project report, screenshots, and future updates, is maintained on GitHub.

GitHub Repository

<https://github.com/1998sumitkumar67-arch/PowerBI-sales-analytics-dashboard>

Repository Contents

- Power BI Dashboard .pbix file
- Dataset .csv file
- Dashboard Screenshots
- PDF Project Report
- README Documentation

The repository serves as a portfolio project demonstrating practical Business Intelligence and Data Analytics skills.

Section 21: GitHub Repository Snapshot

The project was published on GitHub to support version control, public portfolio visibility, and professional project documentation. GitHub was used to organize the Power BI file, dataset, screenshots, report files, and README documentation in a single repository.

Figure 21.1 shows the GitHub repository snapshot for the project. This repository allows recruiters, hiring managers, and other users to review the project files and understand the complete workflow followed during the development of the Power BI Sales Analytics Dashboard.

Figure 21.1: GitHub Repository Snapshot

Publishing the project on GitHub strengthens the portfolio value of the work by demonstrating documentation skills, project organization, and the ability to present analytics projects in a professional format.

Section 22: Conclusion

This project demonstrates the complete Business Intelligence workflow using Microsoft Power BI, including data preparation, data modeling, DAX measure development, dashboard design, and business insight generation.

The final solution consists of four interactive dashboard pages:

- Executive Overview
- Product Performance Analysis
- Customer Analysis
- Regional Performance Analysis

The dashboard successfully transforms raw transactional data into actionable business insights and supports data-driven decision-making.

Through this project, practical skills in Power BI, Power Query, DAX, data modeling, dashboard development, GitHub project management, and technical documentation were developed and demonstrated.

The project serves as a strong portfolio example for Data Analyst, Business Intelligence Analyst, and Power BI Developer internship and entry-level roles.
